so we got a whole big ass output and me being lazy asf to read that whole and if we notice it leaks the first names, imma enumerate other ports to see if i get any name from there too
let use enum4linux, its a tool for enumrating tool for windows and running services on it like samba, rpclient, etc.

****enumrating other ports using enum4linux****

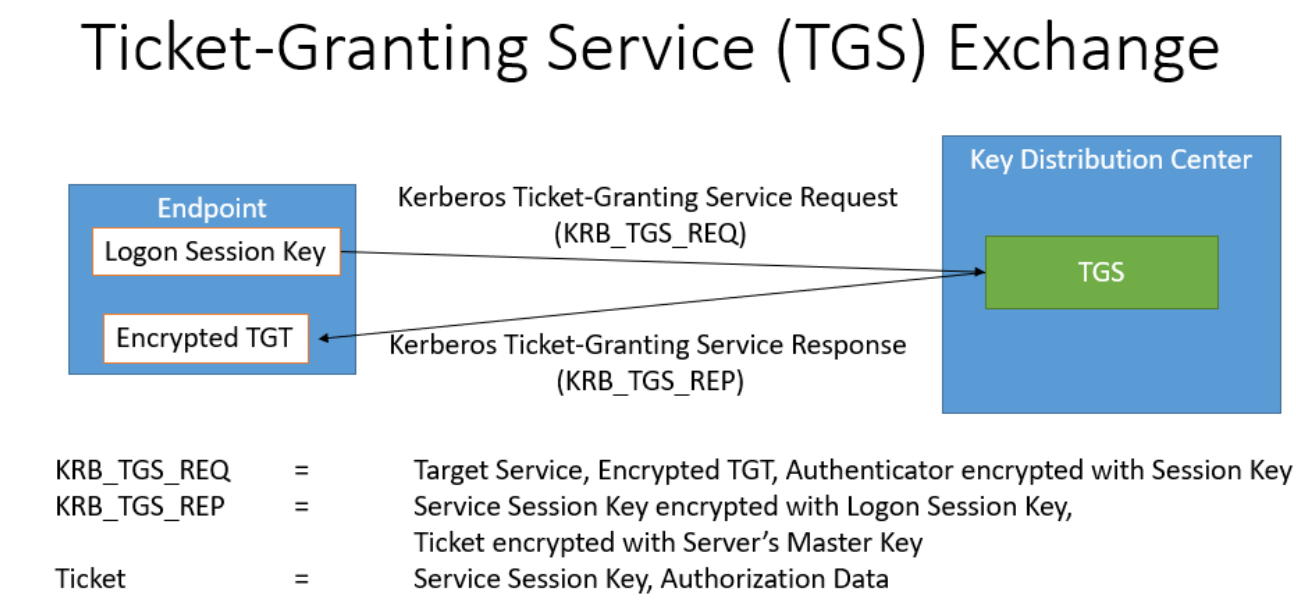
here we go again with another big ass results
well here we got something interesting it leaks all the username, now we have the list of usernames and if kerberos pre user authentication is disabled we could use impacket script to send dummy requests for authentication and key distribution center will return TGT.

this is what i found looking for kerberos exploitation

```
When the user attempts to access a service in the network, the user sends a TGS_REQ to the
Ticket Granting Server (TGS) function of the KDC. This message is encrypted with the logon
```

session key, which is obtained during the AS Exchange. The TGS_REQ is verified by the TGS, which then returns a TGS_REP. The TGS_REP contains a service session key and a service ticket, which is encrypted with the master key of the server that hosts the service. The master key of the server in a Unix-based system is configured in a file called a keytab file. The master key of the server in a member server is derived from the computer account's password. The TGS Exchange is outlined below.



```
Administrator
Guest
krbtgt
DefaultAccount
sebastien
lucinda
svc-alfresco
andy
mark
santi
```

we got filtered users only list using regex

so we successfully gained the rce on the server as user svc-alfresco
lets see what we do have here!

on the user's desktop we got the user flag

```
*Evil-WinRM* PS C:\Users\svc-alfresco\Desktop> ls

so here we goin to run winpeas for post exploitation and privilege escalation
and we need host a smb server on the local machine to copy the file to the box

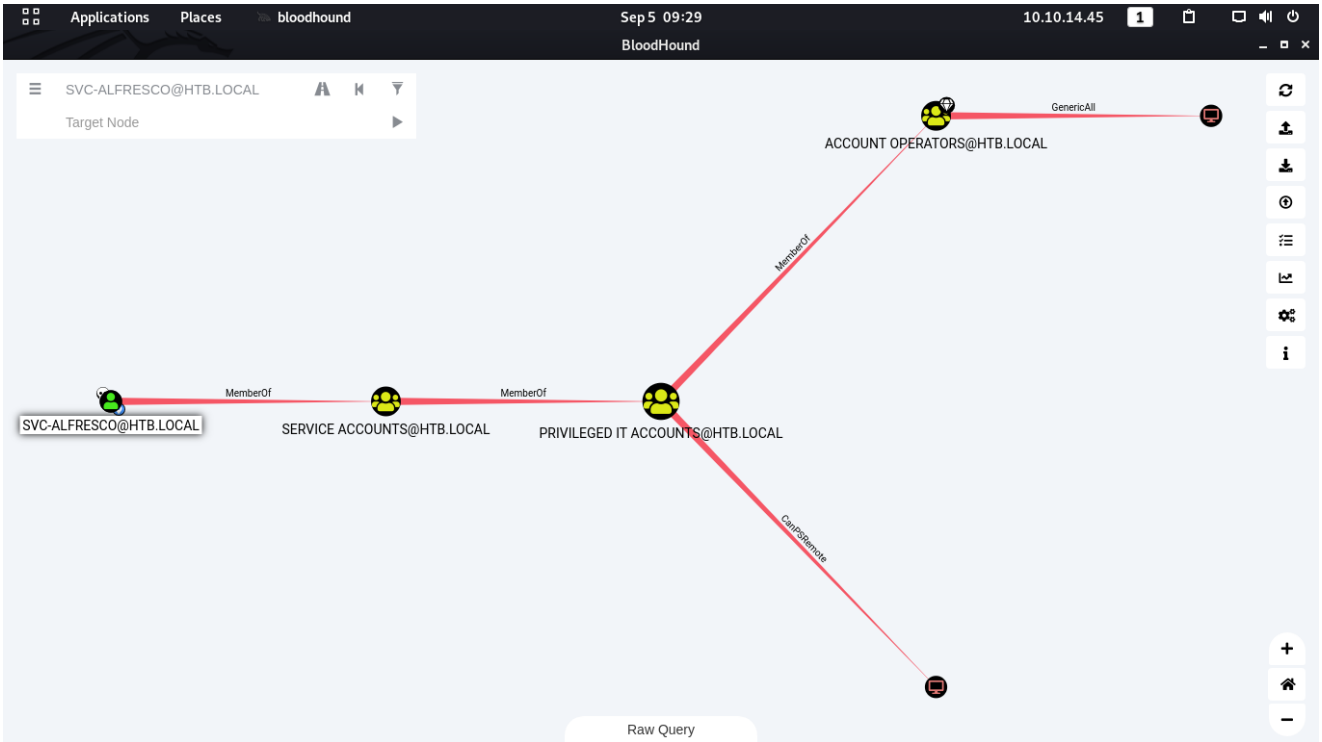
lets just drag and drop the file got from the box



and we get to see some nice graphs. LMAOO! jk

lets break it all down, we can clearly see user *svc-alfresco* is a member of service accounts and *IT privileged accounts* and account opertors also, therefore user *svc-alfresco* can create other users on the domain and modify there permission

The *Account Operators* group has *GenericAll* permission on the *Exchange Windows Permissions* group. This permission essentially gives members full control of the group and therefore allows members to directly modify group membership. Since *svc-alfresco* is a member of *Account Operators*, user is able to modify the permissions of the *Exchange Windows Permissions* group.

The *Exchange Windows Permission* group has *WriteDacl* permission on the domain *HTB.LOCAL*. This permission allows members to modify the DACL (Discretionary Access Control List) on the

domain. We'll abuse this to grant ourselves DcSync privileges, which will give us the right to perform domain replication and dump all the password hashes from the domain.

Putting all the pieces together, the following is our attack map

Create a user on the domain. This is possible because *svc-alfresco* is a member of the group *Account Operators*.
